Identification of a novel homeobox gene product expressed in colonic epithelia. Members of the homeobox gene family encode transcription factors that play an essential role in patterning the early embryo. In addition to its role in development, the homeobox gene product is also implicated in the regulation of gene expression in a number of cell types including those of the nervous system and colon. We now report the isolation of a novel homeobox gene, NCX2, from a panel of PCR-generated homeobox-containing cDNA fragments. The homeobox sequences of NCX2 are completely conserved in mouse, human, chicken, frog, and zebrafish and the 5' flanking sequences have a high degree of identity to those previously reported. However, NCX2 is the first homeobox gene product that is absent from the brain and the retina and whose expression is restricted to the colon. The NCX2 homeobox protein has multiple structural domains including a putative zinc finger and a homeobox. NCX2 transcripts are expressed in the luminal cell layer of the colon with slightly higher levels in the mid region than in the distal region. The pattern of NCX2 transcripts is similar to the known marker of colonic secretory cells, sucrase isomaltase. In contrast to sucrase isomaltase, however, NCX2 expression is restricted to the epithelia. The distribution of NCX2 expression within the colon indicates that it could play a role in the regulation of genes involved in colonic function. Q: how to use Perl's multiline string regex? I am trying to use Perl's pattern match in a regex to match the following. mikelarry The main problem is how to match the text between " and " into the string "mike" and "larry". Can someone help me? I have tried the following, which doesn't work. if ( \$html =~ m/([

### Allnotes PC/Windows

===== KeyMacro is an amazing utility that comes in handy for power users who often need to enter the same type of information in several different windows, such as when you need to open up more than one browser window or need to keep track of a few tasks in several applications. With KeyMacro, you can define a shortcut key or combination of keys to switch between any number of windows in your applications. You can create new rules to switch between specific windows, such as Open in New Window, Save, Run and so on. Features: ===== \* Open multiple instances of any application \* Define customized windows of any application \* Switch between any number of application windows \* Fully customizable keyboard shortcuts \* Drag and drop support between any application windows \* Save your windows settings to restore next time \* Simple and clean user interface \* Supports more than 25 languages \* Works with any installed application \* Supports Windows XP, Windows Vista, Windows 7, Windows 8, Windows 8.1, Windows 10 How to Use: ===== \* First create a rule to open a specific window, in this example it will open a browser window. \* Next, select the window that will be opened. Click on the shortcut keys tab and assign a shortcut key for this rule. To switch windows, use that key. \* For example, if you want to switch between browser and email, you can assign "Ctrl + Alt + B" (or Ctrl + Alt + W). \* Other options such as location, scroll direction, where the app will be opened, and many more can be added to the shortcut. \* Finally, click OK and you're done! Sample Shortcuts: ===== \* Command Prompt \* Programs, Task, Downloads \* Windows explorer \* CMD, Start menu, etc. Install: ===== Report problems or ask questions: ===== Our email address is support@keymacro.com The Official KeyMacro website is: Visit us on: https 81e310abff
