Category:Adobe Inc.Q: Polymer:

How to chain when using `async`
`map`? I am a beginner in using
Polymer. Here is my code:

```
import { html } from '@polymer  
/polymer/lib/utils/html-tag.js';  
//... async function get(path){ let  
data = await (await  
fetch(path)).json(); //... } //... let  
result = await map(fs.readdir,  
async(path) => { return await  
get(path); }); I am wondering  
what is the correct way to
```

chaining here. Do I need to return a Promise to it? Or can I leave it as is? A: You don't need a Promise here, but you should really try to avoid it. If you want to use Promises, you can still keep your code structured and use `async-await` inside the `map` function. The `map` function, which operates on an array, is already asynchronous. So, you just need to use `async-await` as you're used to. For example: `let result = await map(fs.readdir,`

async(path) => { let data = await
get(path); return [...data]; }); But
keep in mind that map will not
run your callback asynchronously
